# Second Case of Vesicular Stomatitis in Texas Detected in Horses in Reeves County

May 22, 2015

The second case of Vesicular stomatitis (VS) in the State has been confirmed in horses in Reeves County, near Orla, Texas (West Texas). This is the first case of VS in Reeves County this year.

On May 19, 2015, the Texas Animal Health Commission (TAHC) announced the State's first case of VS involving three horses in Pecos County.

The newly identified infected premises is currently under quarantine by the TAHC. Affected horses will be monitored by regulatory personnel until all lesions have healed and a decision is made to release the quarantine (a minimum of 14 days). There is no known exposure to other horses around the state, or at any equine events. It is believed that the virus overwinters in the sand and black fly population in northern Mexico and then moves northward in warmer weather.

Some states and other countries may restrict movement of, or impose additional requirements for susceptible species moving from states with active cases of VS. It is important for shippers or haulers of livestock to contact states of destination well in advance of scheduled movements to determine their entry requirements. For international export information, the USDA Veterinary Services office in Austin, Texas should be contacted.
